PPERBB: R65153.

Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins per screening a binding domain and an effector domain bisclosure; Page 35: 255pp; English.

PR COMPAISING a binding domain and an effector domain bisclosure; Page 35: 255pp; English.

CC 70467 is a generic DNA sequence used to generate random TSAR (Totally Spirthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)16/FCC)(NNB)12/NNB)16/FCG(NNB)17. X and Y are flanking restriction sites (X is not the same as Y) that are cont specified further. Other specified further. Other specified further. Other specified peptides generated by these are shown in 070466-68.

CC official signal and a second effector peptide portion that is comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker of that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides are also designed conformational rigidity to the specific target or on the cell. They can also replace the function of macromolecules, eg. conformational antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing director areas and an antipodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1006 taccattgacgccaaattcagcaggtttcgaaatgccgccatttcttgatacttcagaaa 947

C (7069) is a generic DNA sequence used to generate random TSAR peptide

C (TGC) (NMB) (TMB) (TGC) (NMB) (TGC) (NMB) 10-

C (TGC) (NMB) (TGC) (NMB) (TGC) (NMB) 10-

C (TGC) (NMB) (TGC) (NMB) (TGC) (NMB) 10-

Sites (X is not the same as Y) that are not specified further. This

Sequence generates peptides that are cloverleaf in structure. Other

Sequence generates peptides that are cloverleaf in structure. Other

C generic sequences are shown in (70465-68. Other specific peptides

C generated by these generic sequences are shown in R65150-54. TSARs are

C concatenated heterofunctional proteins or peptides, comprising at least

C concatenated heterofunctional proteins or peptides, comprising at least

C second effector peptide portion that is chemically or biologically

C a ctive. They may further comprise a linker peptide between the 2 domains.

C a ctive. They may further comprise a linker peptide between the 2 domains.

C contains 2 or 4 cysteine residues positioned in, or flanking, the

C conformational rigidity to the peptides. The TSARs or compsise.

C conformational rigidity to the peptides. The TSARs or compsise.

C conformational rigidity to the peptides. The TSARs or also replace

C conformation of macromolecules, eq. monoclonal or polyclonal antibodies

C formation or in vivo antibody production. The TSARs are easily

C formation in a screening process.

C detection in a screening process.

Disclosure; Page 35, 255pp; English.

C 070466 is a generic DNA Sequence used to generate random TSAR (Totally
Synthetic Affinity Reagents) peptides. This generic formula can also be
represented as follows: X(NNB)[TGC](NNB)10[TGC](NNB)4Z(NNB)8[TGC](NNB)

OY 0406 is a tare flanking restriction sites (X is not the same as Y)

C 1 that are not specified further other generic sequences are shown in R65151-54. TSARs are concatenated heterofunctional proteins

CC are shown in R65151-54. TSARs are concatenated heterofunctional proteins

CC domain with affinity for a ligand and a second effector peptide portion

C that is chemically or biologically active. They may further comprise a

CC linker peptide between the 2 domains. The oligonucleotides are also

designed so that the expressed peptide contains 2 or 4 cysteine residues

CC clinker peptide between the 2 domains. The oligonucleotides are also

designed so that the expressed peptide contains 2 or 4 cysteine residues

CC residues confer some degree of conformational rigidity to the peptides.

CT or The TSARs or compens. comprising a TSAR binding domain can be used in

C vivo to deliver a chemically or biologically active moiety, eg. metal

CC on the cell. They can also replace the function of macromolecules, eg.

CM on the cell. They can also replace the function of macromolecules.

CC complex methods of hybridoma formation or in vivo antibody production.

CC The TSARs are easily characterised and have designed activity allowing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 311 ttgctatattaactagtggaaaggttaattttcctcctgaagtagtatcttggttaagaa 370

Bacterlophage K3
Viruses: dsDNA viruses, no RNA stage; Tailed phages; Myoviridae.
1 (bases I to 944)
Riede,I., Drexler,K. and Eschbach,M.L.
The nucleotide sequences of the tail fiber gene 36 of bacteriophage
I.2 and of genes 36 of the T-even type Escherichia coli phages K3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /protein_id="Ca15893.1"

On Jul 24, 1998 this sequence version replaced gi:3241936.

Address all correspondence to: Mark Adams The Institute for Genomic Research 9712 Medical Center Dr. Rockville, MD 20850, USA e-mail address: humgen@tigr.org. The orientation of the sequence is from SP6 end to T7 end. Genes were identified by a combination of five methods including: XGRAIL (available by anonymous ftp from arthur.epm.ornl.gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gnomic.stanford.Edu/-chris/GENSCANW.html)searches of the complete sequence against a peptide database, and the Human gene Index database at TISK (http://www.tigr.org/tdb/hgi/hgi.html).

Genes without pepetide homolgy having spliced EST hits are termed 'Unknown gene product'. Genes encoding tRNAS are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       5

http://gnomic.stanford.Edu/-chris/GENSCANW.html)searches of the complete sequence against a peptide database and the Human gene Index database at TIGR (http://www.tigr.org/tdb/hgi/hgi.html). Genes without pepetide homolgy having spliced EST hits are termed 'Unknown gene product'. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RUNSWICK M.J., GENNIS R.B., FERRNLEY I.M., WALKER J.E.;

"Mitochondrial NADH:ubiquinone reductase: complementary DNA sequence of the import precursor of the bovine 75 kDa subunit.";

BICCHEMISTRY 28:9452-9459(1989).

-I- FUNCTION: THIS IS THE LARGEST SUBUNIT OF COMPLEX I AND IT IS A COMPONENT OF THE IRON-SULEVIR (IP) FRAGMENT OF THE ENYME. IT MAY FORM PART OF THE ACTIVE SITE CREVICE WHERE NADH IS OXIDIZED.

-I- CATALITIC ACTIVITY: NADH + UBIQUINONE = NADH;) + UBIQUINOL.

-I- CATALITIC ACTIVITY: NADH + UBIQUINONE = NADH;) + UBIQUINOL.

-I- SUBCELLULAR LOCATION: MATRIX AND CYTOPLASMIC SIDE OF THE MITOCHONDRIAL INNER MEMBRANE.

-I- SIMILARITY: BELONGS TO THE COMPLEX I 75 KD SUBUNIT FAMILY.

RAGAN I., ROBINSON B.H.;

Determination of the CDNA sequence for the human mitochondrial
15-kDa Fe-S protein of NaDH-coenzyme o reductase.*;

EUR. J. BIOCHEM. 201:347-550(1991).

-I-CHUCTION: THIS IS THE LARGEST SUBUNIT OF COMPLEX I AND IT IS A
COMPONENT OF THE IRON-SULFUR (IP) FRAGMENT OF FIRE ENZYME: IT
MAY FORM PART OF THE ACTIVE SITE CREVICE WHERE NADH IS OXIDIZED.

-I-CAPALYTIC ACTIVITY: NADH + UBIQUINONE = NAD(+) + UBIQUINOL.

-I-COPACTOR: MAY BIND ONE 2FE-2S CLUSTER & ONE 4FE-4S CLUSTER.

-I-SUBUNIT: COMPLEX I IS COMPOSED OF ABOUT 30 DIFFERRY SUBUNITS.

-I-SUBCELLULAR LOCATION: MATRIX AND CYTOPLASMIC SIDE OF THE

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This protein resides in the mitochondrial outer membrane (MOM)
Where it serves as part of the receptor complex for mitochondrial preproteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        mitochondrial outer membrane preprotein receptor chain MOM22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Kawarabayasi, Y.; Sawada, M.; Horikawa, H.; Haikawa, Y.;

Threston expression and secretion system in corynebacteria -

Protein expression and secretion system in corynebacteria -

Transformed with cassette contg. signal sequence of protein PSI

Transformed with cassette contg. signal sequence of protein PSI

Transformed colymer and polypeptide prodn.

S Claim 1: Fig 12: 95pp: French.

C N-terminal signal peptide of PS2 is useful in recombinant protein

C C Transformant. Since PS2 is associated with the bacterial cell wall,

C transformant. Since PS2 is associated with the bacterial cell wall,

C and can be recovered (without lysis) by treatment with a surfactant.

Equine rhinovirus 1 (ERNV1) polyprotein amino acid sequence.
Equine rhinovirus 1; ERNV1; foot-and-mouth disease virus; vaccine; horse; diagnosis; antigenss; polyprotein; enzyme-linked immunosorbent assay; recombinant protein.
                                                                                                                                                                                                                                               The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (APCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and defermined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

Detergent compositions comprising Subtilisin variants - which exhibit improved stability and/or wash performance Claim 1: Page - 191pp; English.

Claim 1: Page - 191pp; English.

Claim 1: Page - 191pp; English.

The present subtilace BLG309 variant, which has improved storage stability and/or improved performance in detergents, has a residue to the hydrophobic domain substituted with a more hydrophobic residue. The hydrophobic domain comprises the residues Prol39, Prol31, Ile165, Tyr167, Tyr171 of BLS309 (in BASBPN numbering). Detergent compositions containing the mutant enzyme have improved storage stability, while retaining or improving their wash performance. This variant has a wash performance improving their factor of 3.3 compared to wild type BLS309.

Che wild type BLS309 sequence, Genbank A08332.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Table 19 Page -: 91pp; English.

The present subtilase BLS309 variant, which has improved storage stability and/or improved performance in detergents, has a residue in the vicinity a wild type hydrophobic domain substituted with a more hydrophobic residue. The hydrophobic domain comprises the residues Pro129, Pro131, Ile165, Tyr167, Tyr171 of BLS309 (in BASBPN numbering). Detergent compositions containing the mutant enzyme have improved storage stability, while retaining or improving their factor of 3.3 compared to wild type BLS309.

N.B. Sequence not given in the specification, but constructed using Sequence 269 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           For a second sequence of equine rhinovirus 1 - and derived proteins or virus-like particles, useful in vaccines and as diagnostic agents

For virus-like particles, useful in vaccines and as diagnostic agents

For virus-like particles, useful in vaccines and as diagnostic agents

For virus-like particles, useful in vaccines and as diagnostic agents

For virus-like particles, useful in vaccines to the sequence of the sequence represents the amino acid sequence of the sequence shown that the conclet acid density and base comparison of ERNV1 differs from other runces. To this end, the nucleotide sequence encoding the collyprotein of ERNV1 was deduced. Analysis of this sequence engogests that ERNV1 proteins can be used to make vaccines to protect horses (and ERNV1 proteins can be used to make vaccines to protect horses (and ERNV1) of the ranimals of ERNV1 of sequence primars and probes can be used for diagnosis of ERNV1. Oligonucleotide primars and probes can be used for diagnosis of ERNV1. Oligonucleotide primars and can be used for diagnosis of ERNV1. Oligonucleotide primars of the blood, particularly in ensyme-linked immunosorbent assay. They can differentiate between infected animals will not). Fragments of the on-capsid proteins but vaccinated animals will not). Fragments of the DNA sequence represent individual genes of the virus and can be expressed in host systems to produce recombinant proteins. Virus like particles containing the individual ERNV1 proteins. can also be used as vectors for delivering therapeutic or other useful agents, including vaccinating epitopes from other pathogens or reproductive hormones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1041 tyspfykmakmlfklatlavaamrtkdpvvvvmliadf-gle-vfdtgfffsyfqeklgp 1098

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ð
                                                                                                                                                                                                                                                                                                                   The mutant enzyme is produced by mutating the gene of subtilisin 309 protease and expressing the mutated gene in suitable hosts. The enzyme exhibits improved wash performance in comparison with their wild type parent enzyme. The enzyme is well suited for use in detergent compositions. The wild type sequence is taken from the international Patent Application No. PCT/DK 88/00002.

Sol4) 71D + R170Y + G195E + K251E. The mutant enzyme is produced by mutating the gene of subtilisin 309 protease and expressing the mutated gene in sultable hosts. The enzyme exhibits improved wash performance in comparison with their wild type parent enzyme. The enzyme is well suited for use in detergent compositions. The wild type sequence is taken from the international Patent Application No. PCT/DX 88/00002.

The mutant enzyme is produced by mutating the gene of subtilisin 309 protease and expressing the mutated gene in suitable hosts. The enzyme exhibits improved wash performance in comparison with their wild type parent enzyme. The wild type is well suited for use in detergent compositions. The wild type sequence is taken from the linternational Patent Application No. PCT/DK 88/00002.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure; Page 6; 10pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The wild-type sequence is obtained from the International Patent Application WO. PCT/70K 88/00002. The mutant protease is used in certain detergent compositions formulated as detergent powders contephosphate or zeolite builder, aqueous detergent liquids, nonaqueous detergent liquids, or detergent bars. $024) *36D + H120D + R170Y + G195E + K235L + K251E.

The mutant enzyme is produced by mutating the gene of subtilisin 309 protease and expressing the mutated gene in suitable hosts. The enzyme exhibits improved wash performance in comparison with their wild type parent enzyme. The enzyme is well suited for use in detergent compositions. The wild type sequence is taken from the linternational Patent Application No. PCT/DK 88/00002.

relicobacter protein and sequences and encoded polypeptide(s) - useful in vaccines to prevent H. pylori infection and for diagnosis of H. pylori secreted protein.

This is the sequence of a Helicobacter pylori secreted protein.

This is the sequence of a Helicobacter pylori secreted protein.

This is the sequence of a Helicobacter pylori secreted protein.

This is the sequence of a Helicobacter pylori secreted protein.

The protein may be used in a vaccine to prevent or treat H. pylori in sequences or infection of H. pylori in a sample and the diagnosis of H. pylori infection of H. pylori in a sample and the diagnosis of H. pylori infection of A. pylori in a santisens sequences and can be used to prevent the translation of H. pylori mRNA. Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori sequences of H. pylori (APCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed to rompute evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ore proteins analysed for significant homology to other known or exported.
thuringiensis (B.t.). This sequence represents the MKHHK delta-endotoxin, and has a molecular weight of 33 kDa. Delta-endotoxins have molecular weights ranging from 27-140 kDa, and kill insect larvae upon ingestion. These sequences can be used in insecticidal compositions, which can be used to control lepidopteran and coleopteran pests. These compositions can optionally contain spores from a biologically pure B.t. strain. The compositions also contain at two other delta-endotoxins, each having a molecular weight of 130 kDa. The delta-endotoxins increase the spectrum of available biopesticides, Sequence 294 AA:
                                                                                                                                                                                                                                                                                                                                                                                      119 tqsltvsskfsfnfpvagaennisfsvgfeqnlsttetkteststlmrippqpvsvrprt 178
                                                                                                                                                                                                                                                                                                                                                                                                                    membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli
